verifiers

Ensures ISO/IEC
compliance

PQ Test Kit

Performance Qualification

Axicon's verifiers have been designed to be robust, light weight, and portable, with no moving parts, so that they can provide consistently accurate results. Regular user calibration ensures that they are measuring the reflectance of the barcodes in accordance with the relevant ISO/IEC standards, but they should still be serviced every year by Axicon to check that all the optical components are perfectly clean and in focus, and that the illumination provided by the LEDs is consistent.

Returning a verifier to Axicon for its annual VCAS (verifier cleaning and alignment service) is sometimes difficult for users. This may be because international shipping costs are very high, or that they simply do not want to be without a verifier for even a short time.

Axicon has developed a Performance Qualification Test Kit to meet the requirements of users who want to be able to rigorously check their equipment on-site rather than rely on Axicon's own servicing and factory recalibration service to guarantee this. Many companies, especially those in the pharmaceutical sector, will be familiar with Installation Qualification (IQ), Operational Qualification (OQ), and Performance Qualification (PQ) testing. These are tests designed to check that the relevant equipment has been installed correctly, that the equipment operates correctly, and then works correctly as intended.

About Axicon

Axicon Auto ID is a world leader in barcode verification, having developed and manufactured our own range of verifiers since 1989. Axicon barcode verifiers are used to measure the quality of linear and matrix barcodes, on all levels of product packaging.

Performance Qualification Test Kit

The PQ Test Kit is available for Axicon verifiers, and is available in two forms, one for linear barcode verifiers, and one for the 2D barcode verifiers.

Each kit comprises a set of precision-made, NIST-traceable reference test cards and a protocol document. (NIST is the USA's National Institute of Standards and Technology.) When the user has carried out the PQ test they can be sure the verifier is working as intended, and it can be re-certified as being compliant.

For the linear verifiers, four different test cards will be provided, while for the 2D verifiers, six test cards will be supplied. Each of the cards is printed with a precisely engineered symbol of known size and characteristics, and these are used in turn to check particular aspects of the verifier's operation.

Once the test has been completed satisfactorily, the user can self-certify that their particular verifier is compliant with the relevant ISO/IEC standards. For linear barcodes, these are ISO/IEC 15426-1 and ISO/IEC 15416, while for 2D verifiers they are ISO/IEC 15426-2 and ISO/IEC 15415. (Any verifier that can assess both linear and 2D symbols must comply with all four standards.)

If the verifier does not meet the requirements of the PQ test, it must be returned to Axicon for servicing and factory calibration.
